Part B. CV SUMMARY (max. 5000 characters, including spaces)

International expert in environmental radioactivity, POC flux and gravitational biological pump evaluation. I performed my PhD in Applied Nuclear Physics in the Universidad de Sevilla, developing low level counting techniques for radioactivity counting and development of radiochemical techniques. I fulfilled my postdoc (Fellowship MICINN-Fulbright) in Institut de Ciencia y Tecnología Ambientals, Universidad Autónoma de Barcelona working in the use of radioactive pairs ^{234}Th - ^{238}U y ^{210}Po - ^{210}Pb to estimate ocean carbon export. I specialized in radiochemical methodologies (^{90}Sr), measurement techniques and applications to the ocean.

As assistant professor at U P. Olavide, in collaboration with Dr. F de Soto, we developed stochastic and computational tools to mechanistically simulate sinking particles in the ocean.

With a permanent position in the U Sevilla, I established the research group *Radioactive tracers for environmental processes*. I specialized on one hand on the analysis of the Biological Pump and its accurate quantification, developing innovative approaches. One of my first contributions was a novel method on evaluating particle sinking velocities from the radionuclide disequilibrium. We also applied stochastic simulations understanding ^{234}Th and ^{210}Po profiles according to sampling and bloom moment, including interpretation of flux attenuation. On a second topic, I worked actively on the use of long-life radionuclides (^{129}I , Pu, ^{236}U , using AMS techniques) as tracers of marine water masses, including Lagrangian models of ocean circulation. We make important progresses developing radiometric techniques, analysing biogeochemical models and defining circulation in the Artic, Pacific and Atlantic Oceans. A

third research topic, in the field of Geochemistry, focuses on the analysis of bentonites clays as geological or long-term engineering barriers of nuclear wastes, with the CICCartuja-CSIC.

In the last 10 years, I have led several projects related with the Biological Pump (1 AEI, 3 J. Andalucía and 1 MSCA). We improve and harmonise POC flux and sinking velocity quantification methodologies, including radioactive pairs, sediment traps and particle imaging techniques to ultimately evaluate ocean carbon export and transfer efficiencies. Furthermore, I coordinate the open-access comprehensive Sea of Thorium repository of ^{234}Th - ^{238}U data (>60000 data).
